

ABSTRACT

A system/method for facilitating registration and delivery of authenticated content across a computer network is disclosed herein. The disclosed system/method is particularly advantageous for applications in which it is desirable to rapidly and reliably register users and to authenticate content requests by users in a scalable manner. In preferred embodiments of the disclosed method/system, registration information is only stored in associated databases upon completion of the registration form by a prospective user, and the proposed payment mode is verified as part of the registration process. The disclosed system also ensures that a registered user does not simultaneously receive multiple content files by monitoring and checking the status of each such registered user before delivering content thereto.
